

Using Schneider Electric EcoStruxure Geo SCADA Expert (ClearSCADA) to Manage District Flow Meter Telemetry with DNP3-WITS Protocol

Graham Nasby
Water SCADA & Security Specialist
City of Guelph Water Services
Guelph, Ontario, Canada

About the Speaker

Graham Nasby, P.Eng., PMP, CAP

Water SCADA & Security Specialist

City of Guelph Water Services

- 10 years in the consulting sector
- Joined Guelph Water Services in 2015
- Vice-president of Industries & Sciences in ISA
- Co-chair of ISA112 SCADA Systems standards committee
- Voting member of ISA101 HMI Design and ISA18 Alarm Management standards committees
- Named Canadian Expert on IEC/SCC-TC65 with Standards Council of Canada
- Active member of American Water Works Association and Water Environment Federation
- Has published over 40 papers and articles on automation topics
- Received University of Guelph “Mid Career Achievement Award” in 2014
- Named ISA’s technical division leader of the year award in 2013.
- Contact: graham.nasby@guelph.ca

Presentation Outline

- About Guelph
- DMA Flowmeter System
- Flowmeter Selection
- Flowmeter Communications
- Why use DNP3-WITS ?
- Introduction to DNP3-WITS
- Implementation Challenges
- What DNP3-WITS allows us to do
- How We Use DMA Flowmeter Data

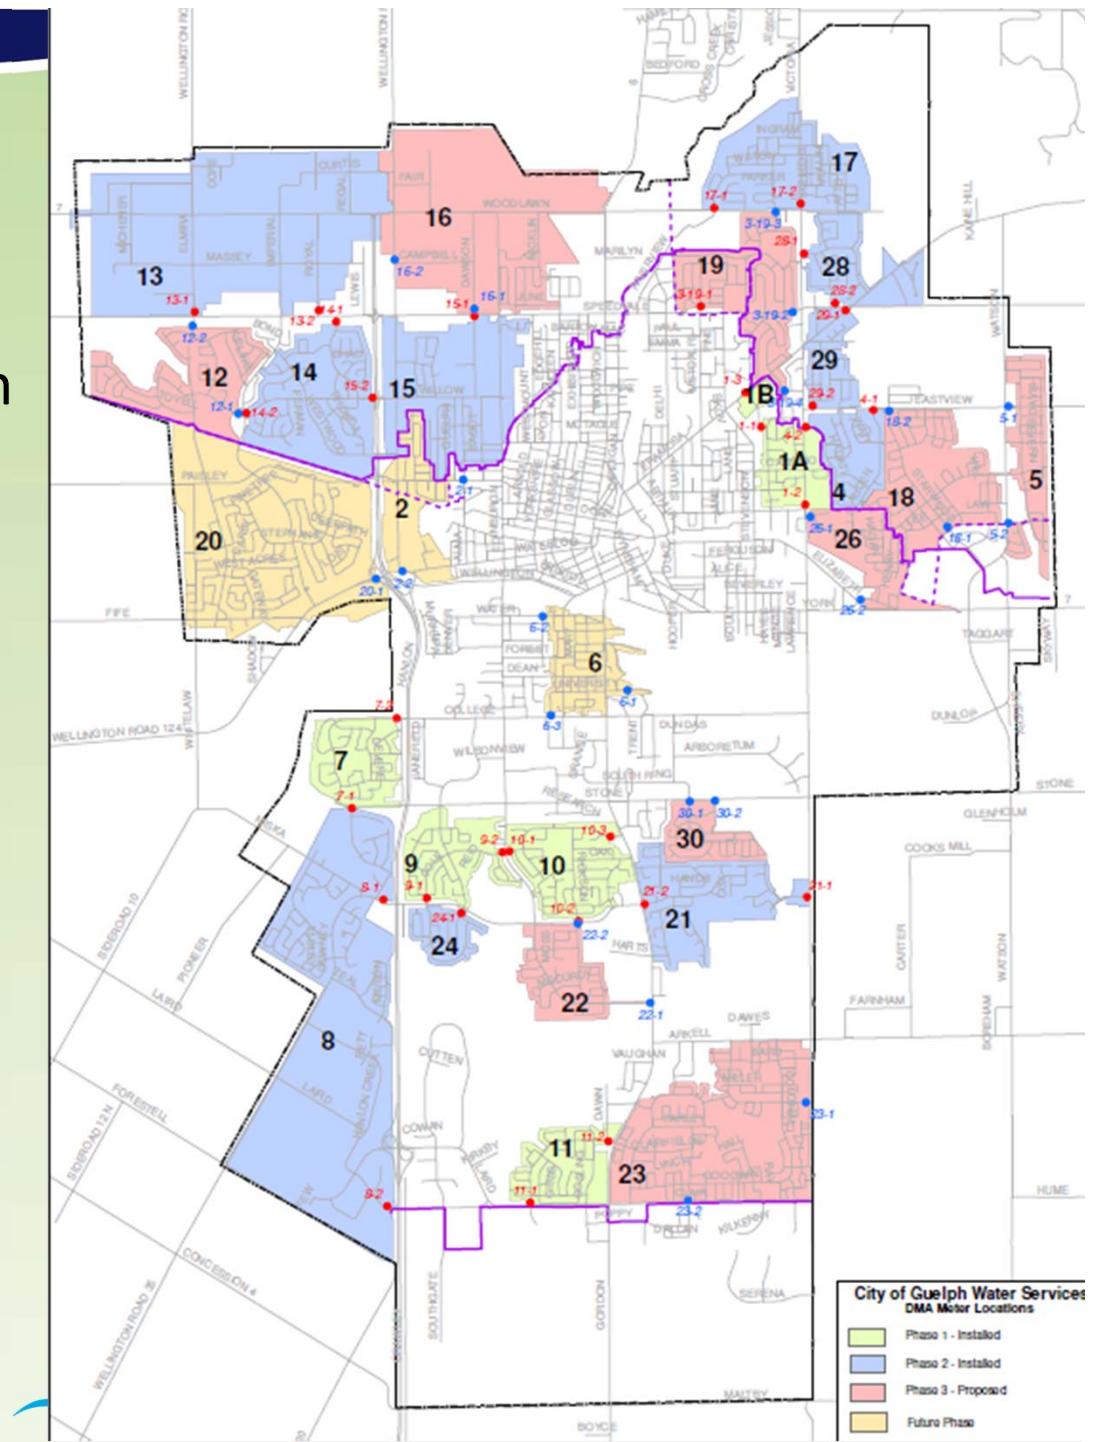

City of Guelph Water Services

- Guelph, Ontario, Canada
- 140,000 residents
- 21 groundwater wells
- 3 water towers
- 549 km of water mains
- 49,000 service connections
- 2,750 fire hydrants
- 46,000 m³/day [12 MGD]

District Metered Areas

- Segments Water Distribution into DMA Areas with 1-3 connections on borders
- Put flowmeters on the DMA's border connections
- What this give us:
 - Water in/out of DMAs
 - Compare to Customer Meters
 - Compare to Wells & Pumping Station meters
 - Calibrate Water Models

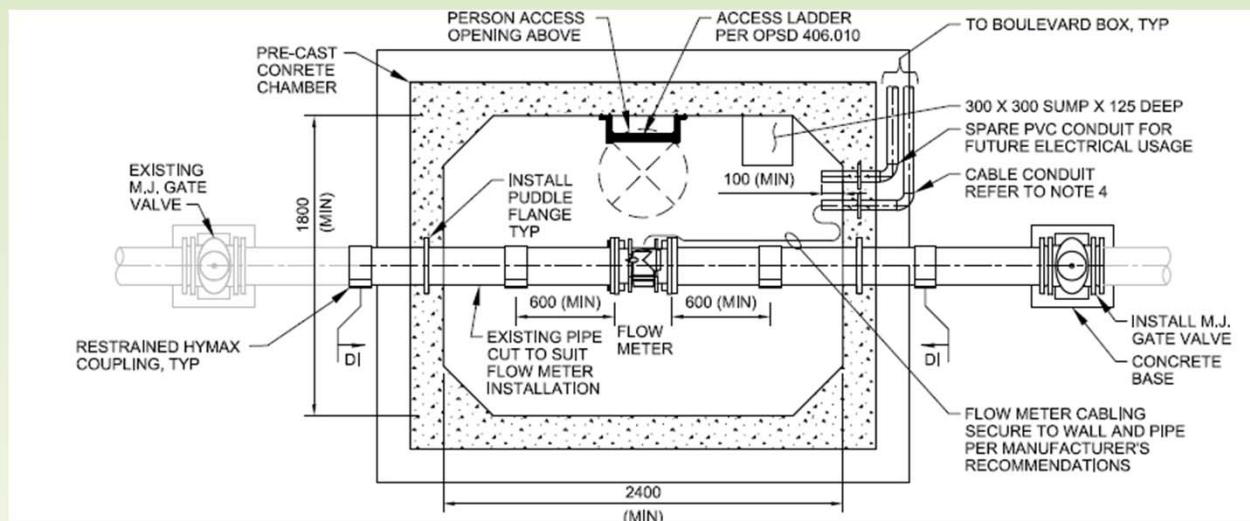

District Flow Meters

- Magnetic Flowmeter
- Integrated Remote Transmitter
 - Transmitter
 - Data Logger
 - Cellular Modem & Antenna
 - Built-in DNP3-WITS Protocol
 - IP 68 Submersion Rated
 - Long Life Battery
- Flow Tube
 - IP68 Submersion Rated

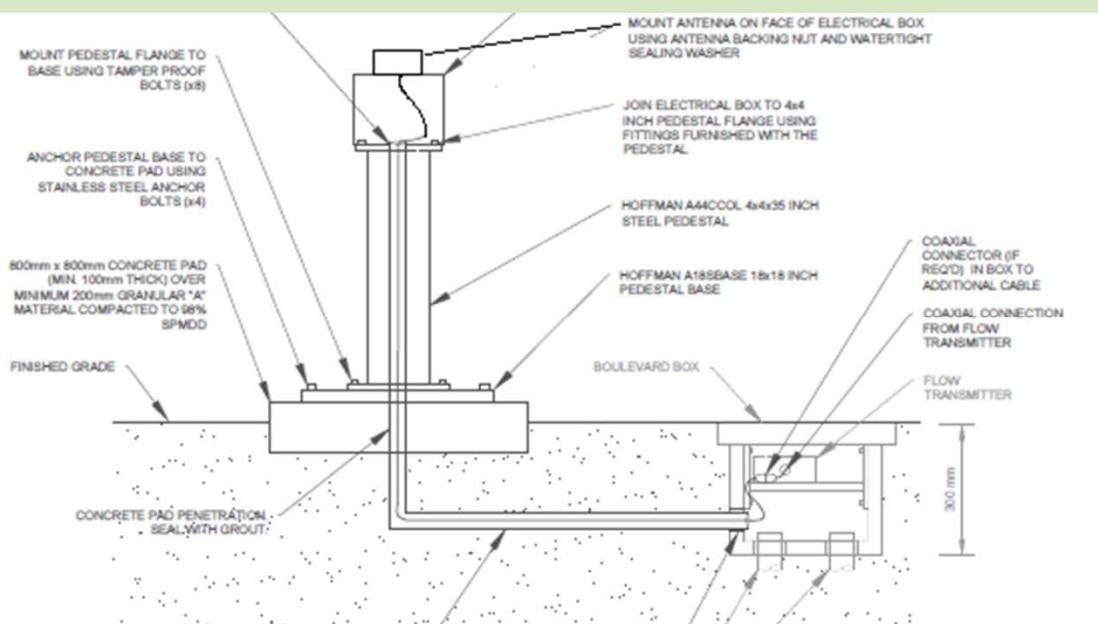

Flowmeter Chambers

- Each DMA is enabled by closing valves, so only 2-3 entry points
- Put Flowmeter chamber on each of DMA's entry points
 - Chamber contains the Flowmeter "flow tube"
 - Pressure sensor (also monitored by flowmeter electronics)
 - Upstream and downstream isolation valves

Flowmeter Transmitters

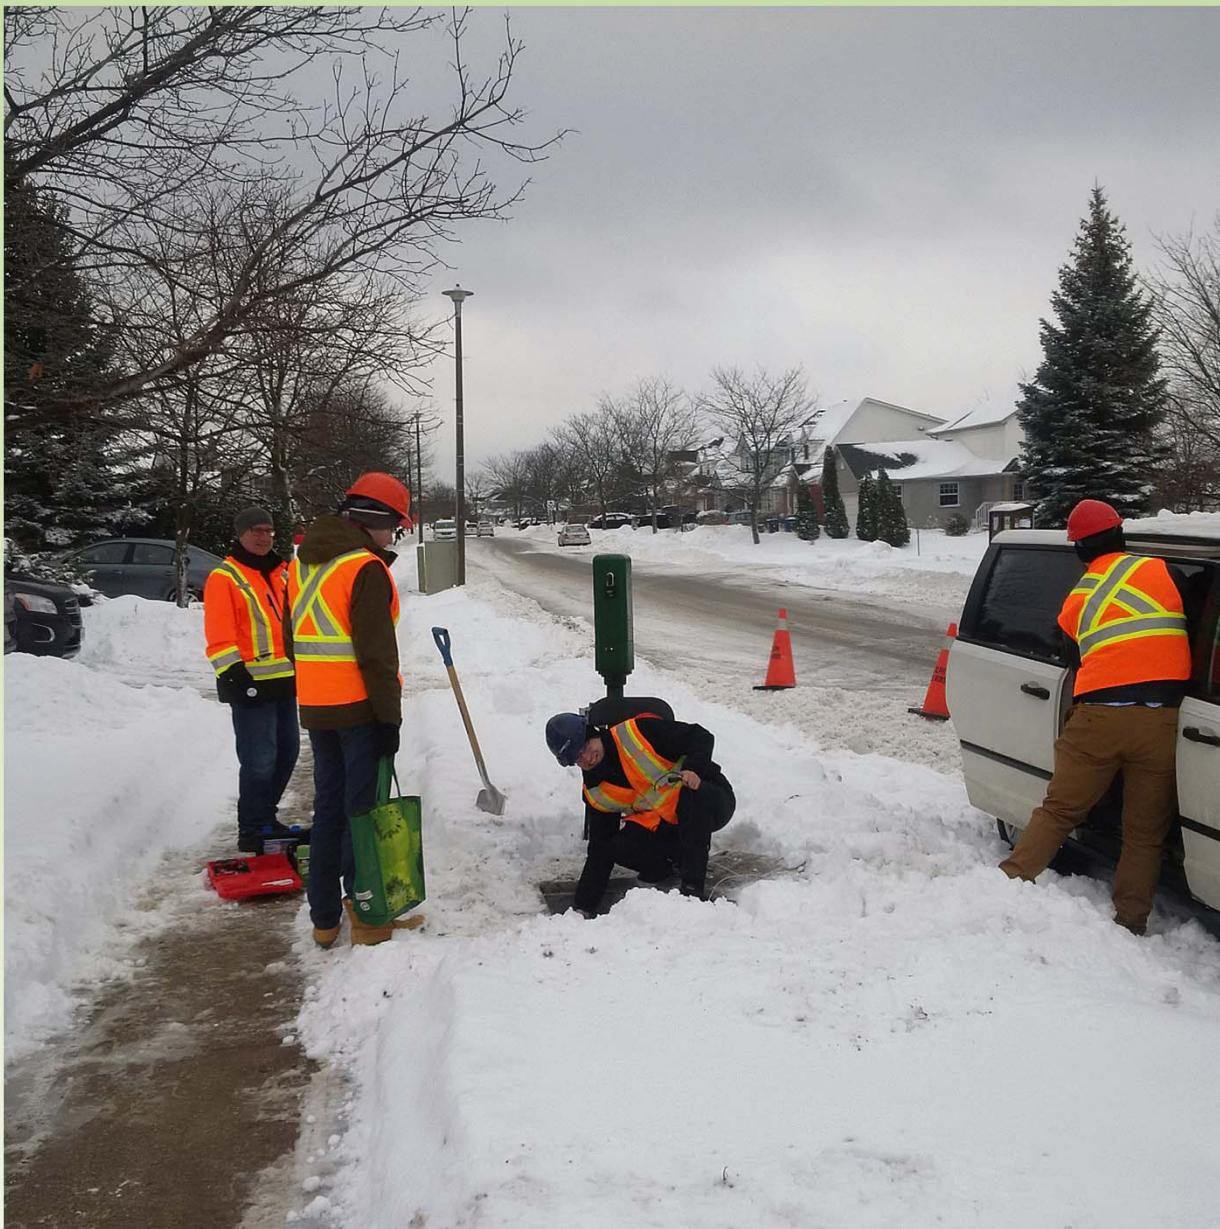

- Flowmeters installed into boulevard boxes
- Antenna pedestals to mount cellular antennas on

District Metered Area Flowmeter Telemetry
Using ClearSCADA & DNP3-WITS Protocol

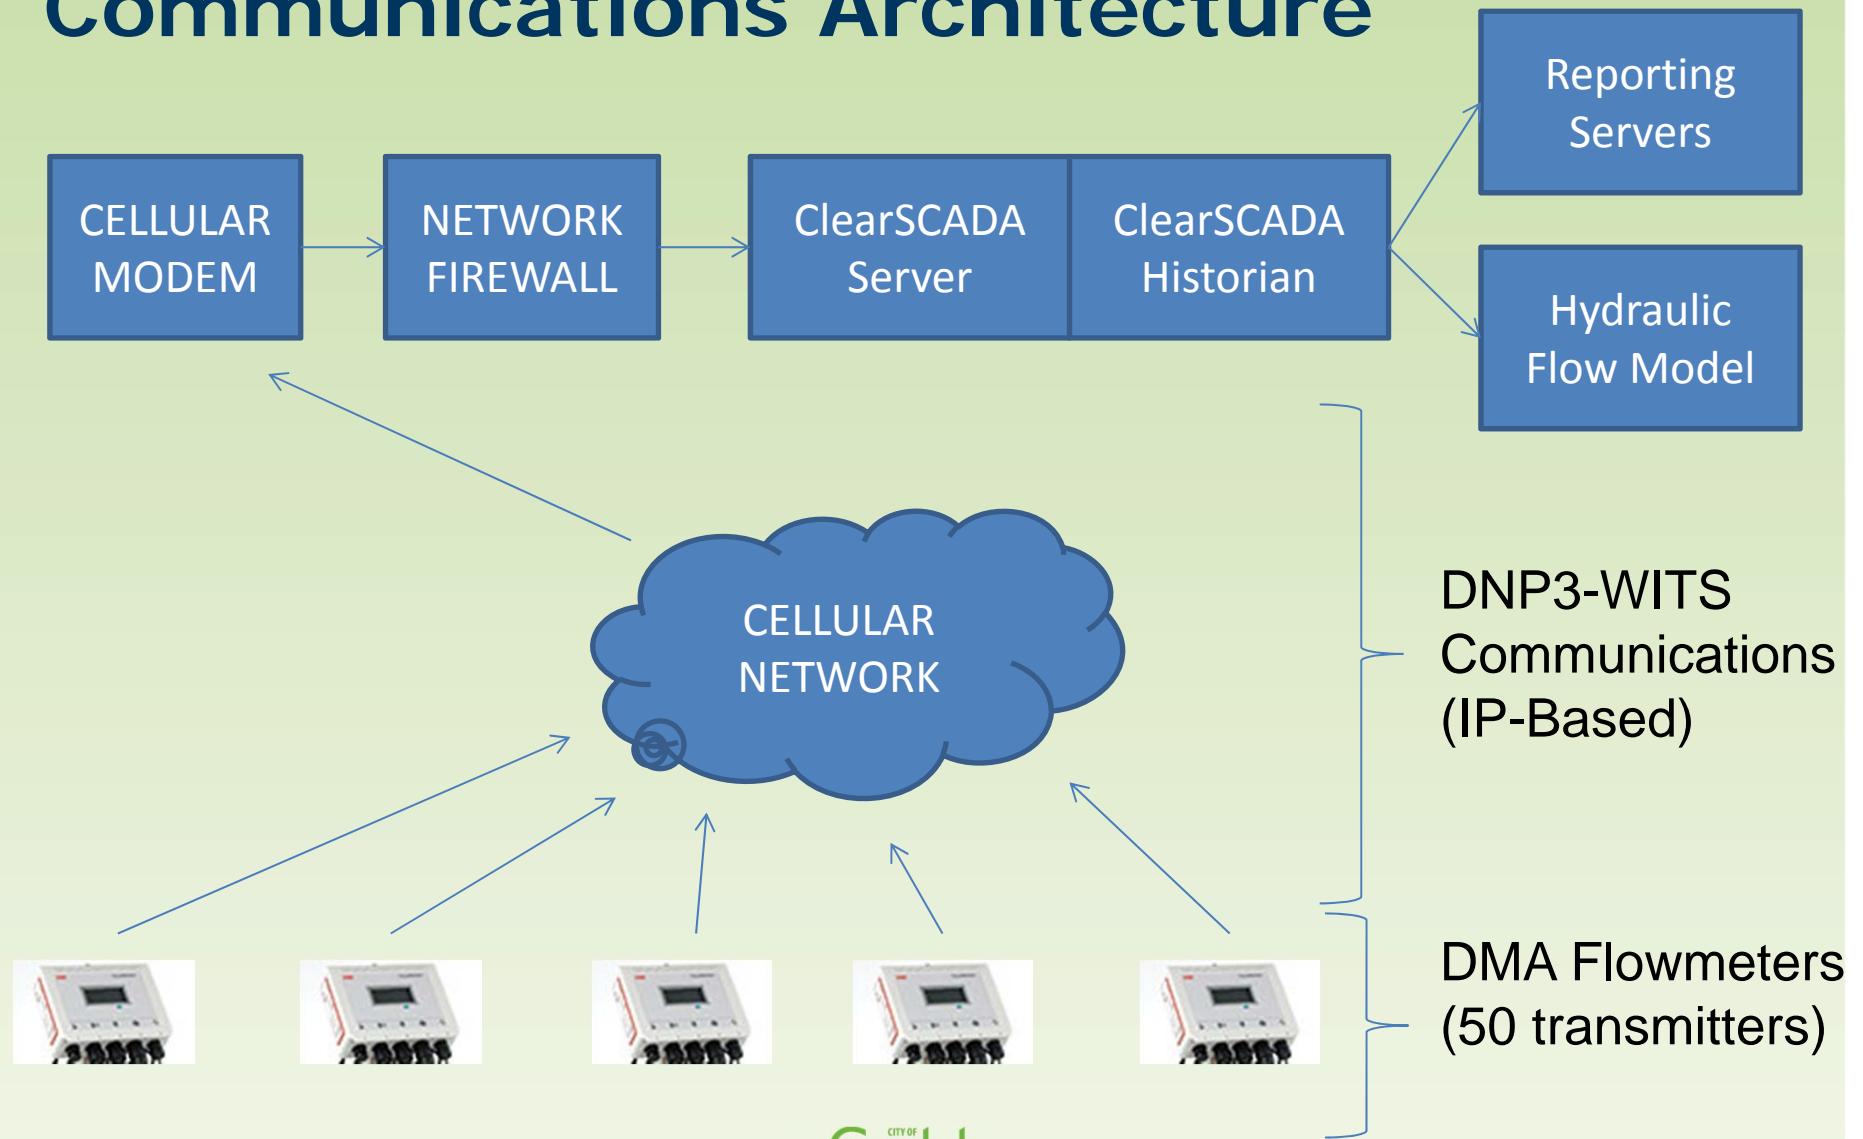

District Metered Area Flowmeter Telemetry
Using ClearSCADA & DNP3-WITS Protocol

Communications Architecture

District Metered Area Flowmeter Telemetry
Using ClearSCADA & DNP3-WITS Protocol

Why DNP3-WITS Protocol?

- Publicly available and non-proprietary! (www.witsprotocol.org)
- Supports both cumulative totalizers and instantaneous flow
- Automatic store and forward data logging built into protocol
- Automatic time-stamping of data at the flowmeter
- Automatic time synchronization of all flowmeters
- Remote configuration of flowmeters using XML device profiles
- Remotely configure data logging interval on meters
- Remotely configure data upload interval from meters
- Extensive troubleshooting tools are standard with DNP3-WITS

Welcome to the
WITS Protocol Standards Association

Introduction to WITS and the Protocol Standards Association

Designed By The Water Industry For The Water Industry

Most water companies use telemetry to monitor and control their remote assets. Traditionally, telemetry systems consist of "Field Devices" which are linked to a "Master Station" using one or more telemetry protocols and communication methods. Many protocols are proprietary and suffer from vendor lock-in. Other open standards can be difficult to match with the water industries' particular set of needs. The WITS Protocol is different...[\[Read more\]](#)

Developing The WITS-DNP3 Protocol

The Water Industry Telemetry Standards (WITS) group was formed in 2003 by members drawn from a wide cross

Water Industry Telemetry Standards Group

A brief history

Supporters included

- Anglian Water
 - Environment Agency
 - Northumbrian Water
 - Scottish Water
 - Severn Trent Water
 - Thames Water
 - United Utilities
 - Wessex Water
 - Yorkshire Water
 - * And now Guelph Water Services
- UK
Water
Utilities

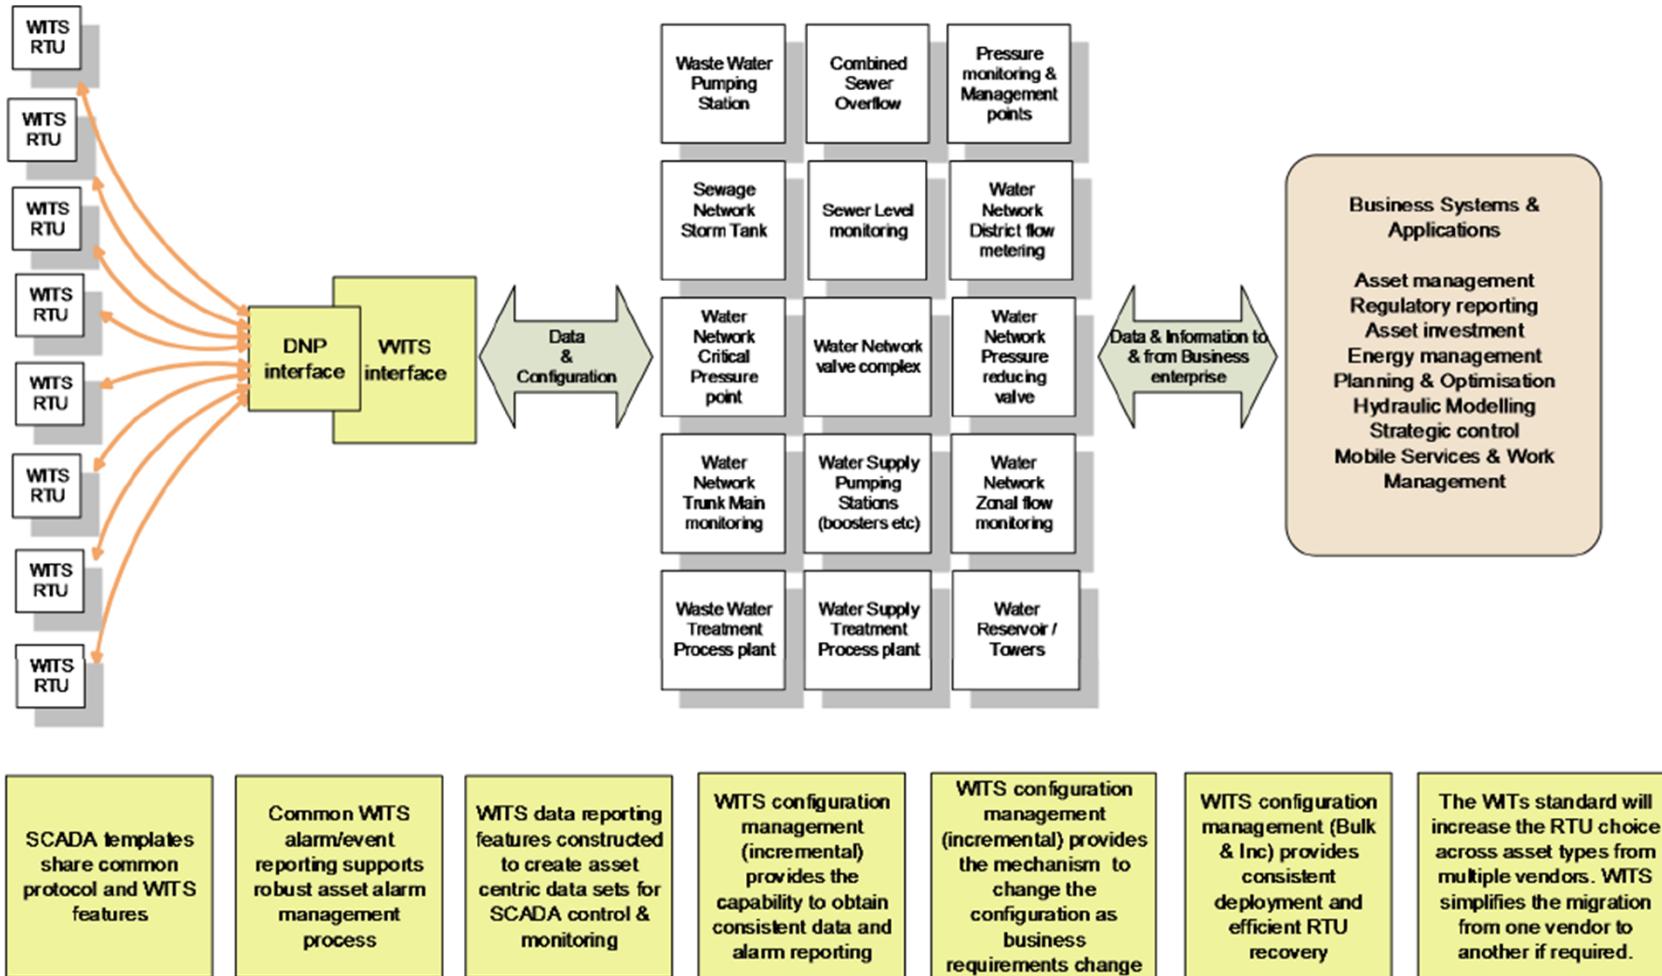

- In the water industry, telemetry system vendors developed proprietary protocols for communications between their field devices and master stations.
- Consequently end users of the telemetry system became locked in to the particular supplier.
- The Water Industry Telemetry Standards (WITS) group was created in 2003 to introduce change
- The first project undertaken was to produce an open standard for transferring data between field devices and a telemetry master station
- Designed By The Water Industry For The Water Industry

Protocol Selection Development and Testing

- To provide the required interoperability and the water industry functionality, there was the need for a precise specification
- This was achieved through the development of the Application Notes and associated test specifications
- Six water industry telemetry suppliers developed both master stations and field devices to prove and enhance the specification.
- The WITS DNP 3 Protocol Standard was then released as an 'open standard'

WITS provides a common SCADA interface and standard data sets

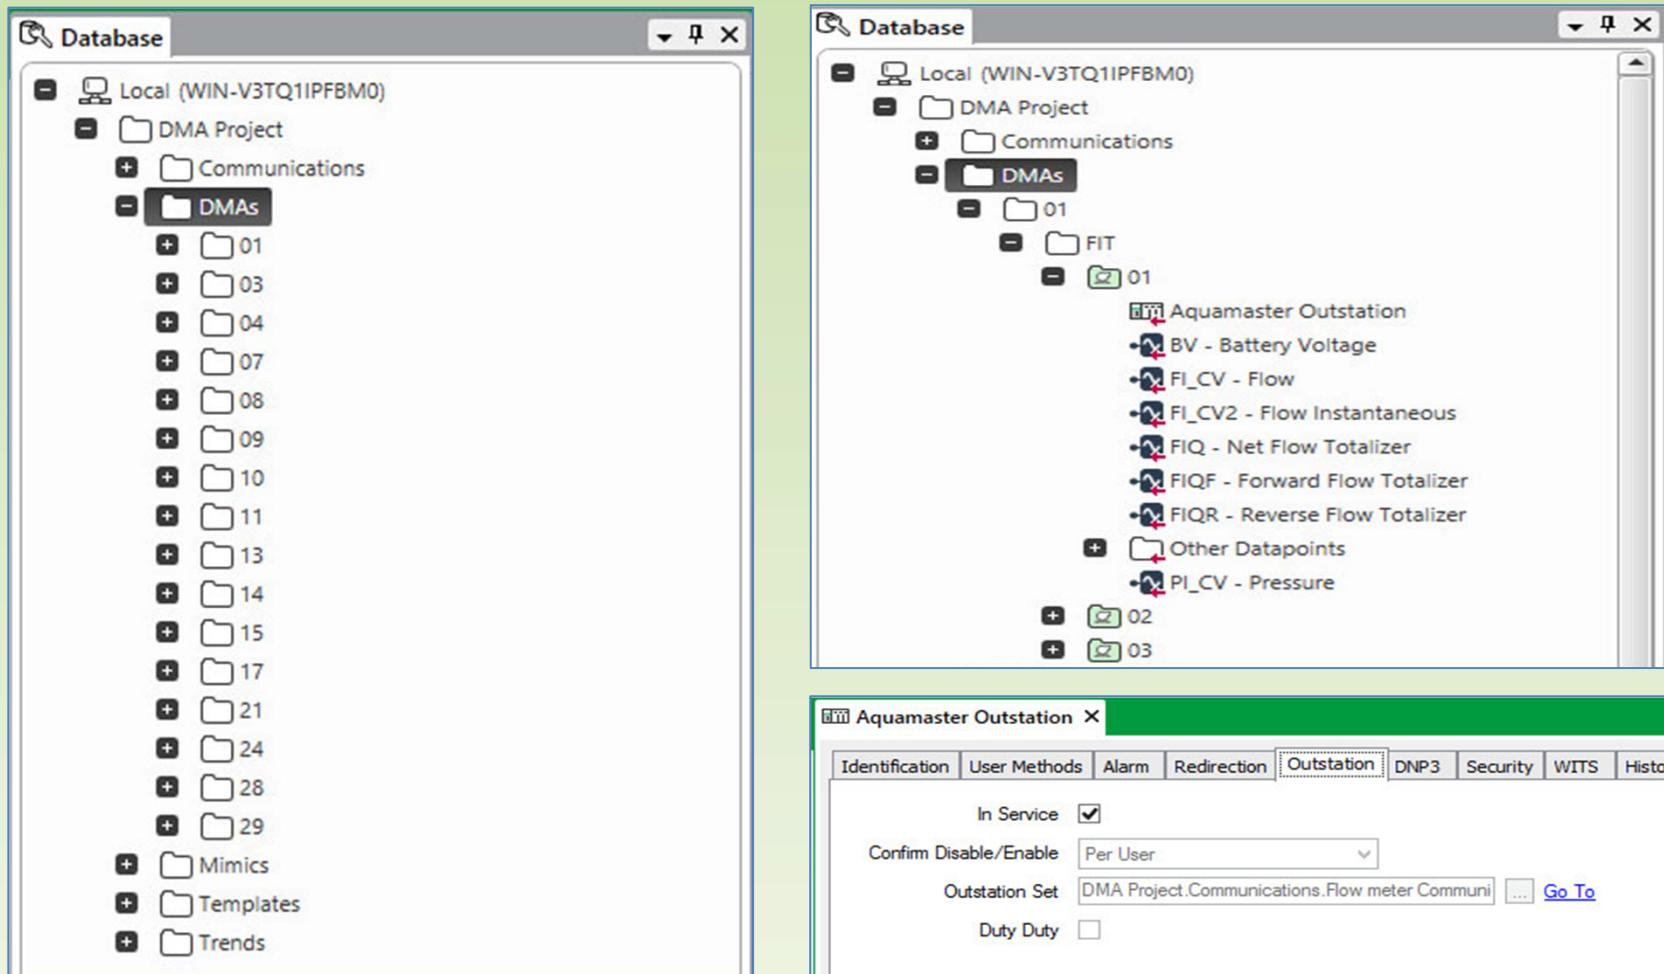

DNP3 Layer Technical Details

- Timestamping data at the device/instrument
 - Automatic Time synchronization
 - Automatic store/forward data logging in protocol
 - Both “Change on Value” and “Polling Interval” data gathering
 - Data Quality Flags
-
- Supports both Encryption and Authentication
 - Automatic Error checking of data packets
 - Prioritized Communications (Tags can be grouped in classes 0-4)
 - Variety of networks supported: Ethernet, serial, ATM, cellular, etc.
 - Supports wide range of analog, digital and structured datatypes

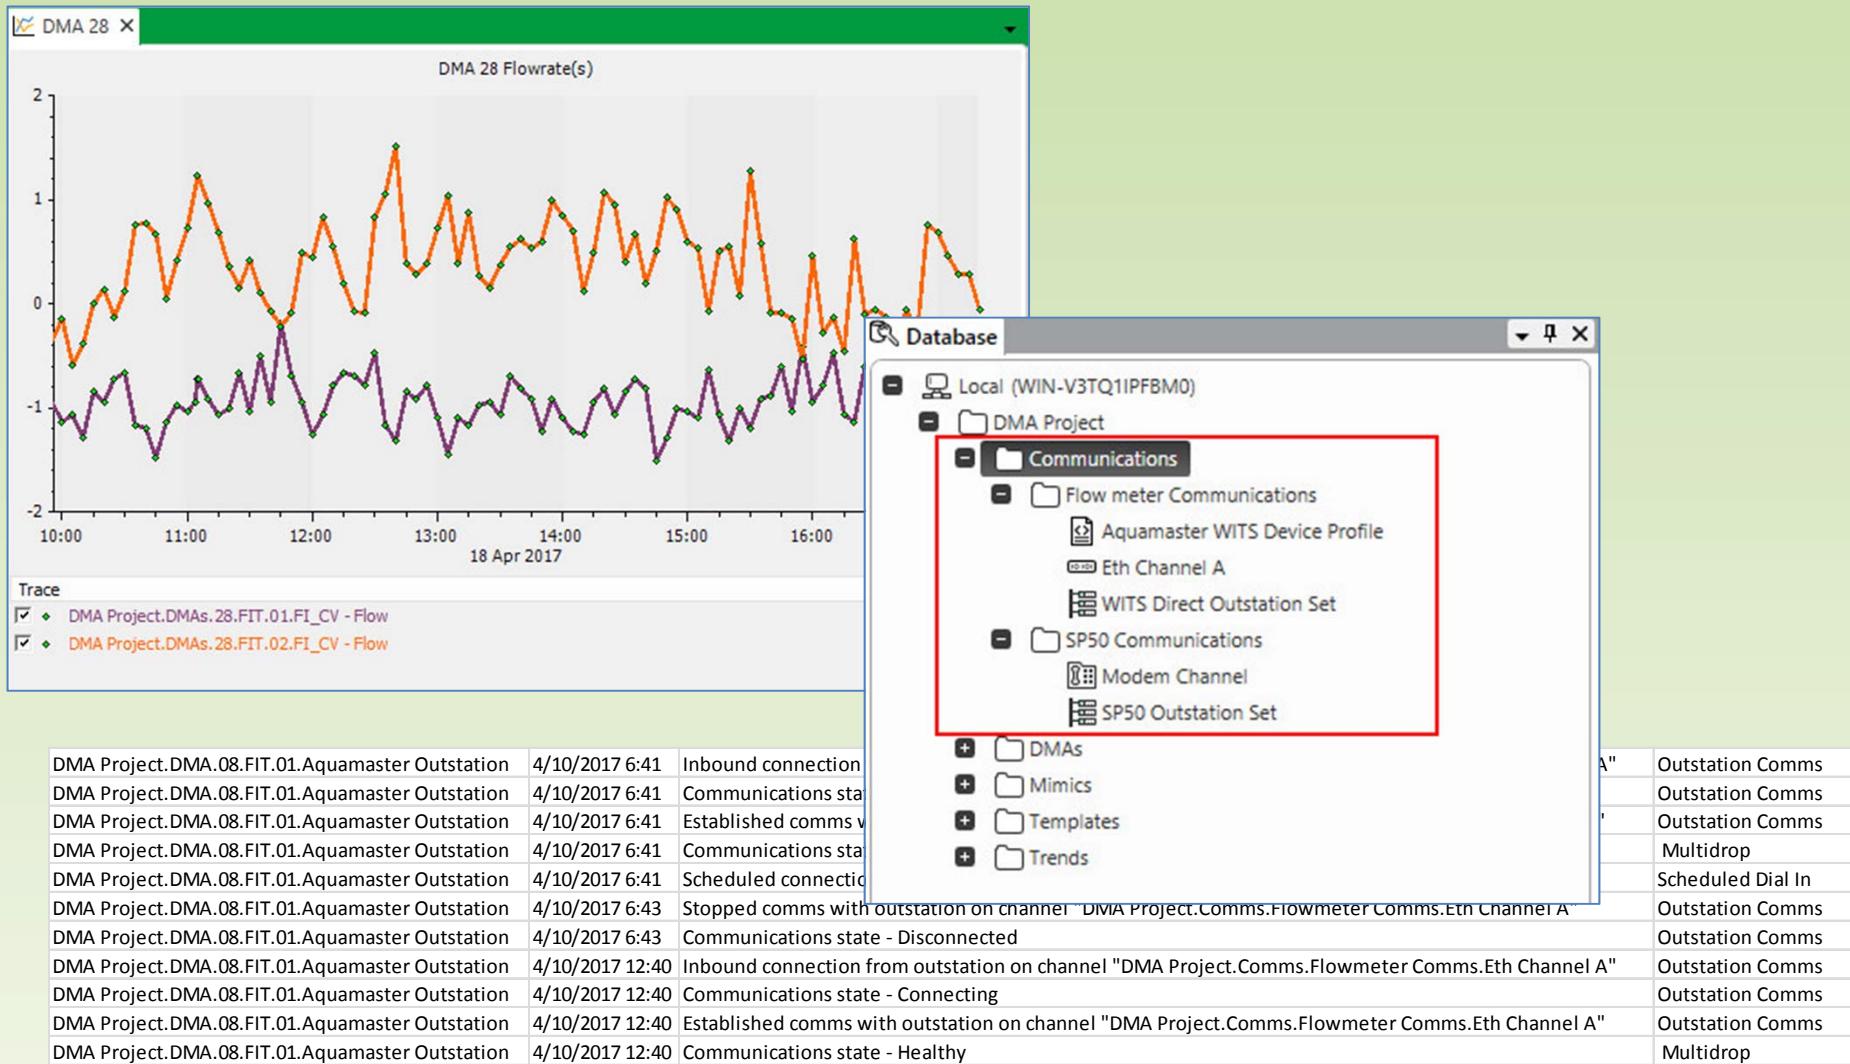

WITS Layer Technical Details

- Devices can be remotely configured/queried from SCADA
- Statistics generation at the device (min, max, average, totalization)
- Dynamically configurable periodic/event-based logging
- Device can generate its own alarms which are timestamped
- Remote configuration/setup of devices
- XML-based device profile templates, make for very fast setup
- When a device added, data tags come automatically from its profile
- Advanced troubleshooting/diagnostics via SCADA software
- **No custom programming needed for telemetry**

WITS: Configuration on ClearSCADA

WITS: ClearSCADA Tools

WITS SCADA Objectives

- Obtain consistent data sets and alarm/event reporting.
- Standardise data/alarm/logging configuration for all asset types.
- Minimise the number of SCADA interfaces for RTU types.
- Remove the bespoke development required for each of the vendor RTUs on the estate.
- Reduce the support requirement to maintain the RTU standard configurations.
- Improve SCADA security. (RTU / SCADA communications secure authentication).

The screenshot shows the ClearSCADA software interface. On the left is a tree view of the database structure under "Local (CLEARSCADA-DMA)". The structure includes "DMA_Project" with sub-folders like "Alarms", "Communications", "Datagrids", "DMA" (containing "01" through "15"), and "FIT" (containing "Aquamaster Outstation", "BV", "FI_CV", "FI_Q", "FI_QF", "FI_QR", "Other Datapoints", and "PI_CV"). The main workspace displays a status bar with event details: "Events on area \"DMA_....DMA.10.03.FIT\"", "DMA_Project.DMA.10.03.FIT.FI_CV", "Events on area \"DMA_....DMA.10.03.FIT\"", and "DMA_Project.DMA.10.03.FIT.FI_CV X". Below the status bar is a table showing a single event record:

Time	Value	State	Quality	Reason	Status	Suppression Type
9/10/2019 7:46:44.000 PM	7.351327 l/s	Normal	Good	Current Data	Online	None

On the right, a modal dialog box titled "SQL" contains the following query:

```

SELECT TOP(100000)
    "RecordId", "RecordTime" AS "~Time", "FormattedValue", "StateDesc", "QualityDesc", "ReasonDesc", "StatusDesc"
FROM
    CDBHISTORIC
WHERE
    "Id" = 2135 AND "~Time" BETWEEN { OPC 'Hour - 23 Hours' } AND { OPC 'Hour - 23 Hours+1 Day' }
ORDER BY
    "~Time" DESC, ".FileOffset" DESC
  
```

Buttons for "OK" and "Cancel" are visible at the bottom of the SQL dialog.

Database OPC Data Queries

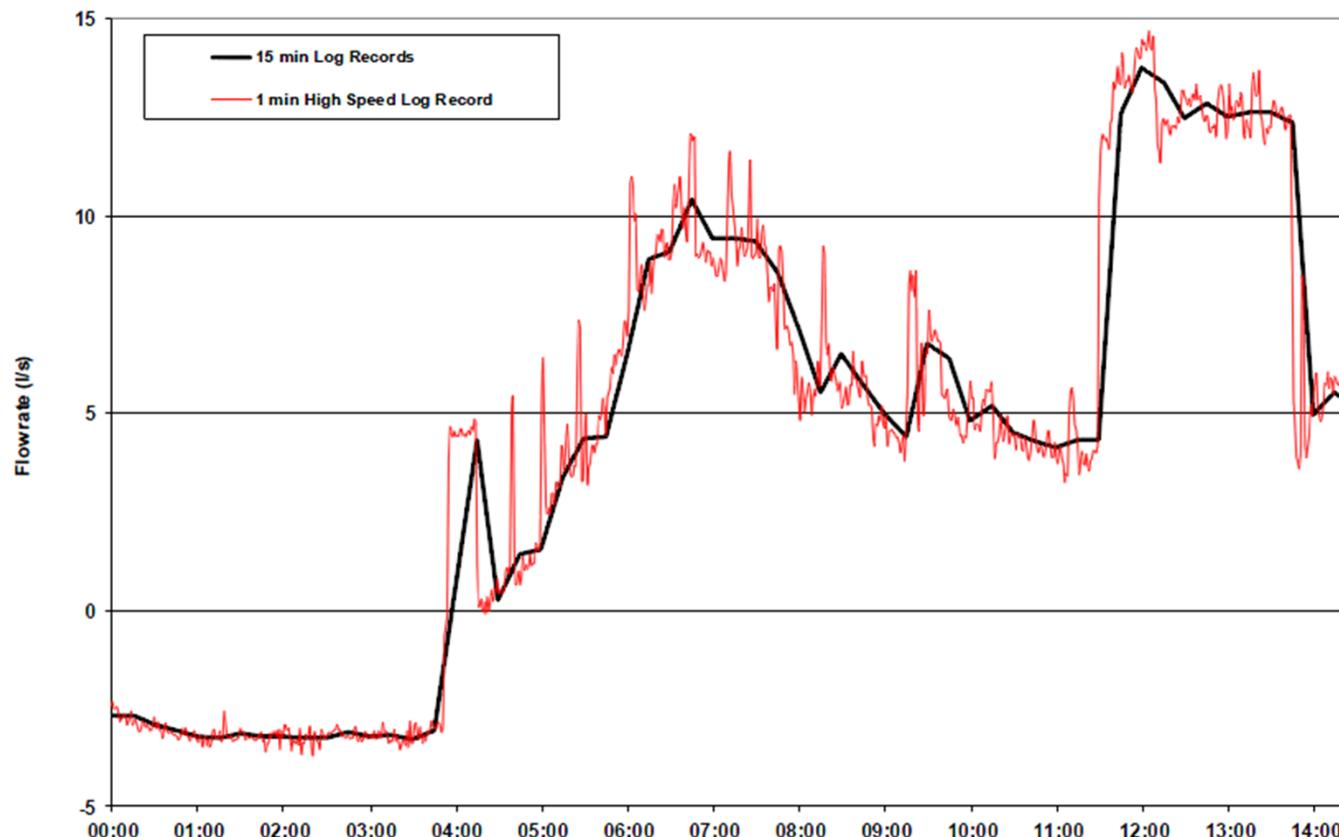

Interesting Things we can do using **DNP3-WITS Protocol**

Integrated Flowmeter and WITS Solution Resolution - Amplitude

- Traditional solutions - result is quantised and incorrect values being reported
- This phenomena is worse at low flowrates, e.g nightlines

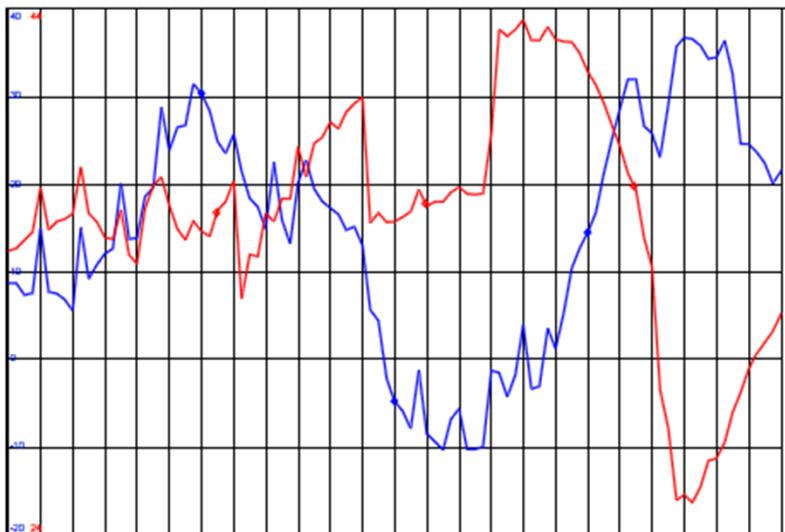

Integrated Flowmeter and WITS Solution Resolution - Time

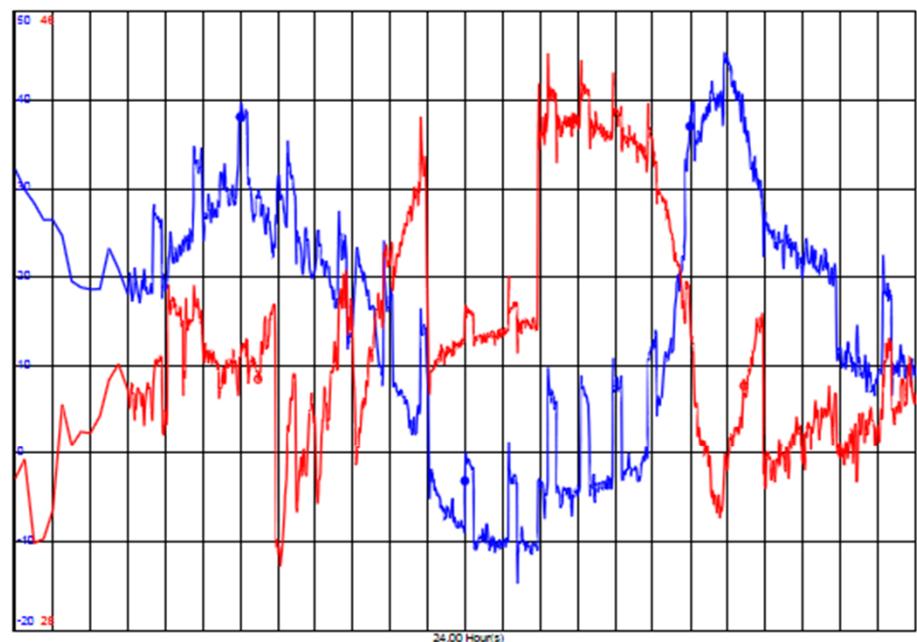

- 15 min log record, compared to 1 min high speed log records, results in significant “Aliasing”, loss of detailed flow information and under reading of peak flowrates.

Integrated Flowmeter and WITS Solution Resolution – Time

15 min records

1 min records

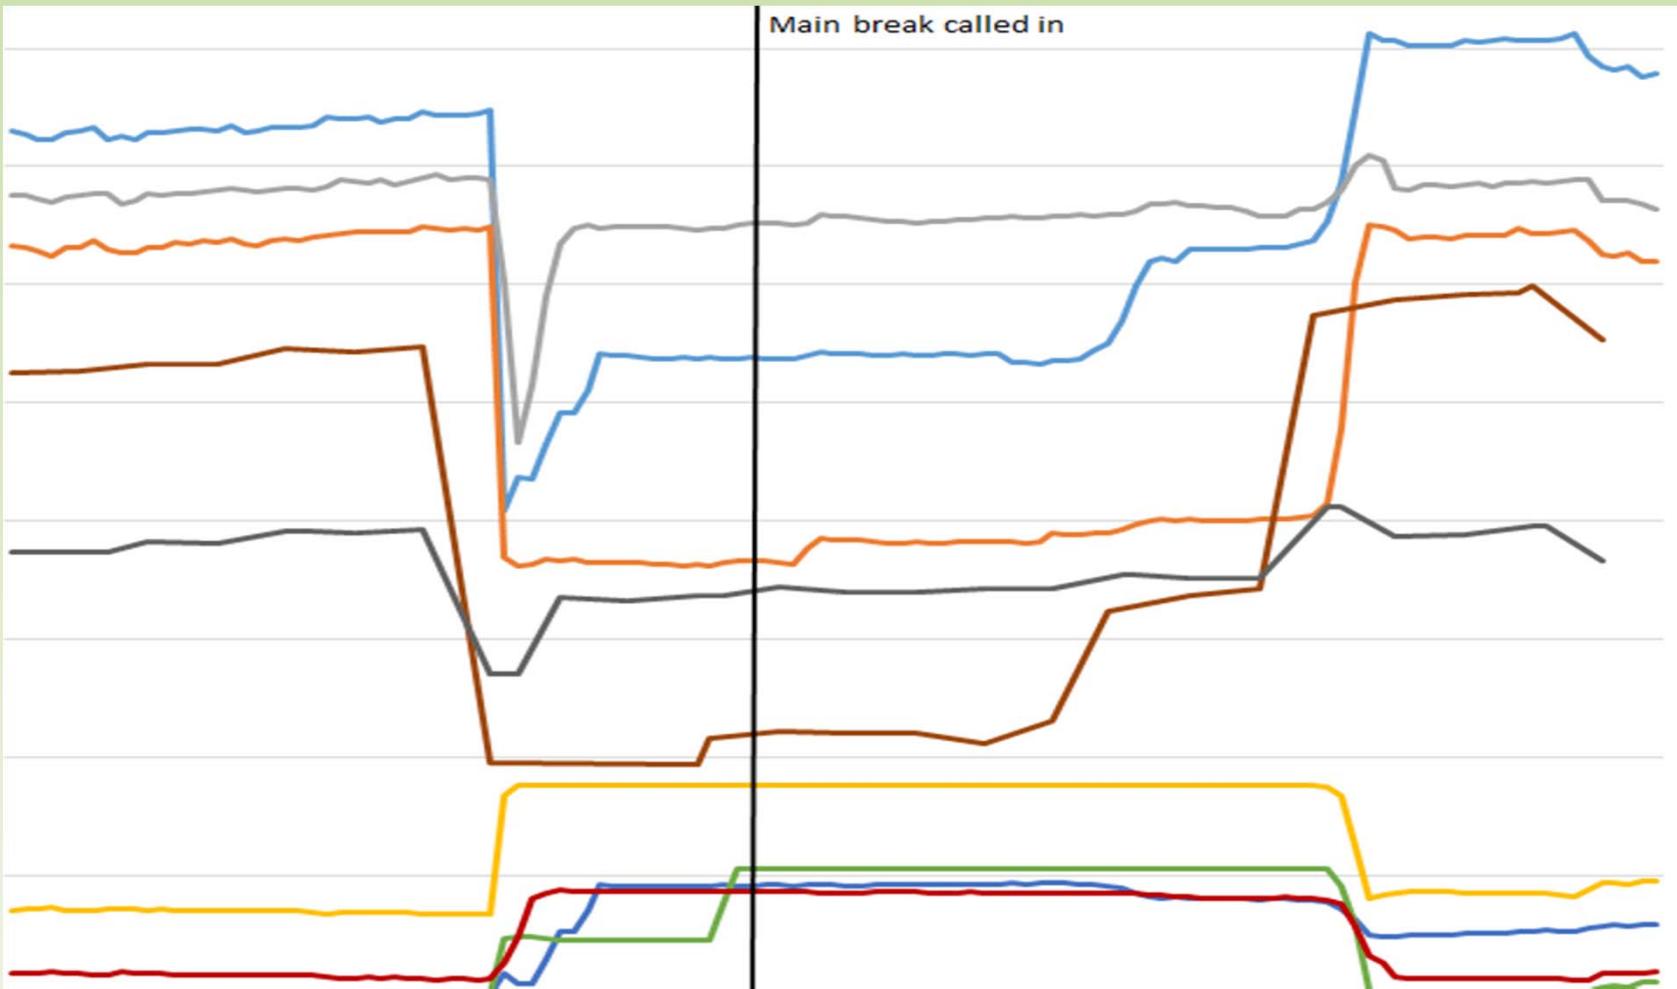

- Note erratic and low resolution information on 15 min data

Flowrate – Blue
Pressure - Red

How we use our DMA Flowmeter Data

- Water Balances: Production vs. Pumping vs. Usage
- Identifying High Leakage Areas for Investigation
- Monitoring Pressure (using pressure probes on meters)
- Auditing Customer Meter Areas
- Calibrating the Hydraulic Model: Flow In/Out of DMAs
- Forecasting Water Demand
- Watermain break investigations
- Identifying low flow areas in the distribution network
- Identifying “low flow” areas at risk of freezing in winter
- Etc.

Example: Using DMA flowmeter data for analysis
